Using The System Setup And Boot Manager

System Setup enables you to manage your system hardware and specify BIOS-level options.

The following keystrokes provide access to system features during startup:

Keystroke	Description
<F2>	Enters the System Setup.
<F12>	Enters the Boot Manager.

From the System Setup, you can:

- Change the NVRAM settings after you add or remove hardware
- View the system hardware configuration
- Enable or disable integrated devices
- Set performance and power management thresholds
- Manage system security

From the Boot Manager, you can:

- Verify the boot mode and the secure boot status
- Select a one-time boot device
- Perform hardware diagnostics
- Configure the Intel Management Engine BIOS Extension
- Update the BIOS

Choosing The System Boot Mode

System Setup enables you to specify the boot mode for installing your operating system:

- Legacy boot mode (the default) is the standard BIOS-level boot interface.
- Unified Extensible Firmware Interface (UEFI) boot mode is an enhanced 64-bit boot interface based on UEFI specifications that overlays the system BIOS.

In **System Setup**, select boot mode in the **Boot List Option** field of the **Boot Sequence** screen. Once you specify the boot mode, the system boots in the specified boot mode and then proceeds to install your operating system from that mode. Thereafter, you must boot the system in the same boot mode (Legacy or UEFI) to access the installed operating system. Trying to boot the operating system from the other boot mode will cause the system to halt at startup.

NOTE: Operating systems must be UEFI-compatible to be installed from the UEFI boot mode. DOS and 32-bit operating systems do not support UEFI and can only be installed from the Legacy boot mode.

NOTE: For the latest information on supported operating systems, go to dell.com/ossupport.

Entering System Setup

1. Turn on or restart your system.
2. Press <F2>.

If your operating system begins to load before you press <F2>, allow the system to finish booting, and then restart your system and try again.

Hard drives

Your system supports 2.5-inch and 3.5-inch hard drives. Choosing the right drive type depends on the usage pattern. Improper use of hard drives will lead to significant risk and increase the drives failure rate.

⚠ CAUTION: Do not turn off or reboot your system while the hard drive is being formatted. Doing so can cause a hard drive failure.

✎ NOTE: Use only hard drives that have been tested and approved for use with your system.

✎ NOTE: To install more than four drive devices (including optical drive and hard drives), you need an additional power extension cable, controller card, and SATA cables (minimum 1.6 ft).

✎ NOTE: The screws that secure the 2.5-inch hard drive to the hard drive cage are available on the front of the hard drive cage.

NOTE: Use the vertical type SATA cables to connect hard drives in the hard drive cage to avoid damaging the connector pins. This is applicable for the 2.5-inch hard drives and optical drive.

NOTE: Use right angle connectors to connect to the hard drives in the hard drive bay. You may not be able to close the system cover if incorrect connector cables are used.

NOTE: Do not mix enterprise class hard drives with entry-level hard drives.

Your system supports four 3.5-inch entry-level hard drives and enterprise class hard drives. Entry-level hard drives are designed for 8x5 operating environment and enterprise class hard drives are designed for 24x7 operating environment. Two hard drives are located in the removable hard drive cage and two hard drives are located in the fixed hard drive bay.

Choosing the right hard drive type depends on the usage pattern. Improper use of entry-level hard drives (including workloads exceeding 550 TB/year) leads to significant risk and increases the failure rate of the drives. Due to industry advances, in some cases, the larger capacity drives have been changed to a larger sector size. The larger sector size can have impacts on operating systems and applications. For more information about these hard drives, see the 512e and 4Kn Disk Formats white paper and 4K Sector HDD FAQ document at **Dell.com/poweredgemanuals**.

All hard drives are connected to the system board through the hard drive backplane. Hard drives are supplied in hot-swappable hard drive carriers that fit in the hard drive slots.

When you format a hard drive, allow enough time for the formatting to be complete. Be aware that high-capacity hard drives can take a long time to format.

System memory

Your system supports DDR3 unbuffered ECC DIMMs (ECC UDIMMs). It supports DDR3 and DDR3L voltage specifications.

⚠ **CAUTION: Dell recommends you to use ECC DIMMs to minimize the risk of uncorrectable system error, data loss and/or silent data corruption. Non-ECC DIMM is not used for mission-critical applications.**

✎ **NOTE: Non-ECC DIMMs are supported only in selected countries, for more information contact your sales representative.**

✎ **NOTE: MT/s indicates DIMM speed in MegaTransfers per second.**

✎ **NOTE: Non-ECC memory is supported in selected countries only, please contact your sales representative for details**

⚠ **CAUTION: Dell recommends that you use ECC memory to minimize the risk of uncorrectable system error, data loss and/or silent data corruption. Non-ECC memory shall be selected for NOT mission-critical usage.**

Memory bus operating frequency can be 2133 MT/s, 1600 MT/s and 1333 MT/sdepending on:

- DIMM type (UDIMM)
- DIMM configuration (number of ranks)
- Maximum frequency of the DIMMs
- Number of DIMMs populated per channel
- DIMM operating voltage
- System profile selected (for example, Performance Optimized, Custom, or Dense Configuration Optimized).
- Maximum supported DIMM frequency of the processor

The system contains four memory sockets — two sets of 2-sockets each. Each 2-socket set is organized into one channel. In each socket set, the first socket release lever is marked white and the second socket release lever is marked black.
Figure 25. Memory socket locations on the system board
Figure 26. Memory Socket Locations
Figure 27. Memory socket locations on the system board

Memory channels are organized as follows:

Processor 1   channel 0: memory sockets A1 and A3

channel 1: memory sockets A2 and A4

The following table shows the memory population and operating frequencies for the supported configurations.

DIMM Type	DIMMs Populated/ Channel	Operating Frequency (in MT/s)		Maximum DIMM Rank/Channel
		1.5 V	1.35 V	
UDIMM	2	1333, 1600	1333, 1600	Dual rank

General memory module installation guidelines

Memory configurations that fail to observe these guidelines can prevent your system from booting, stop responding during memory configuration, or operating with reduced memory.

NOTE: This system supports only UDIMMs.

The system supports Flexible Memory Configuration, enabling the system to be configured and run in any valid chipset architectural configuration. The following are the recommended guidelines for installing memory modules:

- Up to two UDIMMs can be populated in a channel.
- Populate all sockets with white release tabs first, and then all the sockets with black release tabs.
- Populate the sockets by the highest rank count, in the following order—first in sockets with white release tabs and then with the black release tabs. For example, if you want to mix single-rank and dual-rank memory modules, populate dual-rank memory modules in the sockets with white release tabs and single-rank memory modules in the sockets with black release tabs.
- Memory modules of different capacities can be mixed provided other memory population rules are followed (for example, 2 GB and 4 GB memory modules can be mixed).
- When mixing memory modules with different capacities, populate the sockets with memory modules with highest capacity first. For example, if you want to mix 2 GB and 4 GB memory modules, populate 4 GB memory modules in the sockets with white release tabs and 2 GB memory modules in the sockets with black release tabs.
- If memory modules with different speeds are installed, they will operate at the speed of the slowest installed memory module(s) or slower depending on system DIMM configuration.

Sample memory configurations

The following table shows sample memory configurations for a single processor configuration that follow the appropriate memory guidelines stated in this section.

CAUTION: Dell recommends you to use ECC DIMMs to minimize the risk of uncorrectable system error, data loss and/or silent data corruption. Non-ECC DIMM is not used for mission-critical applications.

NOTE: 16 GB quad-rank RDIMMs are not supported.

NOTE: Minimum supported memory is 2 GB, and maximum supported memory is 32 GB.

NOTE: 1R and 2R in the following tables indicate single-rank and dual-rank DIMMs respectively.

NOTE: Non-ECC DIMMs are supported only in selected countries, for more information contact your sales representative.

3. Run the appropriate diagnostic test.

System fan

Your system supports one system fan. The system fan is an essential part of a server's cooling system. It ensures that the key components of the server such as the processors, hard drives, and memory get adequate air circulation to keep them cool. A failure in the server's cooling system can result in the server overheating and may lead to damage.

Removing the system fan

CAUTION: Never remove the heat sink from a processor unless you intend to remove the processor. The heat sink is necessary to maintain proper thermal conditions.

NOTE: Do not remove the processor shield retention screw.

4. Disconnect the processor fan cable from the system board.
5. Using a screwdriver, loosen one captive screw that secures the heat sink to the system board.
6. Wait 30 seconds for the heat sink to loosen from the processor and loosen the screw diagonally opposite the screw removed in the previous step.
7. Repeat steps 6 and 7 for the other pair of screws.
8. Lift the heat sink up from the processor and set it aside upside down (thermal grease side facing up).

Installing The Processor

⚠ **CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.**

📝 **NOTE: If you are upgrading your system, download the latest system BIOS version from dell.com/support and follow the instructions included in the compressed download file to install the update on your system.**

1. Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet and peripherals.
2. Lay the system on its side, on a flat and stable surface.
3. Unpack the new processor.

   If the processor has previously been used in a system, remove any remaining thermal grease from the processor using a lint-free cloth.
4. Align the notches on the processor with the socket keys on the ZIF socket.
5. To install the processor in the socket:

   ⚠ **CAUTION: Positioning the processor incorrectly can permanently damage the system board or the processor. Be careful not to bend the pins in the socket.**

   a. Align the notches on the processor with the socket keys and set the processor lightly in the socket.

   ⚠ **CAUTION: Do not use force to seat the processor. When the processor is positioned correctly, it engages easily into the socket.**

   b. Close the processor shield by sliding it under the retention screw until it locks into place.
   c. Press the release lever down and then move it inward to secure it with the retention hook.

6. To install the heat sink:

⚠️ **CAUTION: Applying too much thermal grease can result in excess grease coming in contact with and contaminating the processor socket.**

   a. Open the grease applicator included with your processor kit and apply all of the thermal grease in the applicator to the center of the topside of the new processor.
   b. Place the heat sink onto the processor.
   c. Align the heat sink screws with the corresponding slots on the system board.
   d. Tighten the four screws to secure the heat sink to the system board.

   📝 **NOTE: Tighten the screws diagonally opposite to each other. Do not over-tighten the heat sink retention screws when installing the heat sink. To prevent over-tightening, tighten the heat sink retention screw until resistance is felt, and stop once the screw is seated. The screw tension should be no more than 6 in-lb (6.9 kg-cm).**

   📝 **NOTE: Do not remove the processor shield retention screw.**

7. Connect the processor fan cable to the system board.
8. Close the system.
9. Place the system upright on a flat, stable surface.
10. Reconnect the system to its electrical outlet and turn the system on, including any attached peripherals.
11. Press <F2> to enter the System Setup and check that the processor information matches the new system configuration.
12. Run the system diagnostics to verify that the new processor operates correctly.

Troubleshooting your system

Safety first—for you and your system

⚠️ CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

Power LED Diagnostics

The power button LED located on the front of the chassis also functions as a bicolored diagnostic LED. The diagnostic LED is only active and visible during the Power On Self Test (POST) process. Once the operating system starts to load, it is no longer visible.

Amber LED blinking scheme – The pattern is 2 or 3 blinks followed by a short pause then *x* number of blinks up to 7. The repeated pattern has a long pause inserted in the middle. For example, 2, 3 = 2 amber blinks, short pause, 3 amber blinks followed by long pause then repeats.

Table 13. Power LED Diagnostics

Amber LED State	White LED State	Description
off	off	system is off
off	blinking	system is in sleep state
blinking	off	power supply unit (PSU) failure
steady	off	PSU is working but failed to fetch code
off	steady	system is on

Amber LED State	Description
2,1	system board failure
2,2	system board, PSU, or PSU cabling failure
2,3	system board, memory, or processor failure
2,4	coin-cell battery failure
2,5	corrupt BIOS
2,6	processor configuration failure or processor failure
2,7	memory modules are detected, but a memory failure
3,1	possible peripheral card or system board failure
3,2	possible USB failure
3,3	no memory modules are detected
3,4	possible system board error

Amber LED State	Description
3,5	memory modules are detected, but a memory configuration or compatibility error
3,6	possible system board resource and/or hardware failure
3,7	some other failure with messages on screen

Memory Beep Code

The system emits a series of beeps during startup if it detects no memory. The beep code pattern emitted is 1-3-2 (1 beep, then 3 beeps, then 2 beeps). The delay between each beep is 300 ms, the delay between each set of beeps is 3 secs, and the beep sound lasts 300 ms. Reseating the memory modules may fix the memory errors. After emitting beeps, the BIOS will detect if the user presses the power button and will execute the normal shutdown process and power the system off.

Troubleshooting System Startup Failure

If you boot the system to the BIOS boot mode after installing an operating system from the UEFI boot mode, the system hangs. The reverse is also true. You must boot to the same boot mode in which you installed the operating system.

For all other startup issues, note the system messages that appear on the screen.

Troubleshooting external connections

Ensure that all external cables are securely attached to the external connectors on your system before troubleshooting any external devices.

Troubleshooting the video subsystem

1. Check the system and power connections to the monitor.
2. Check the video interface cabling from the system to the monitor.
3. Run the appropriate diagnostic test.

If the tests run successfully, the problem is not related to video hardware.

If the tests fail, see Getting help.

Troubleshooting a USB device

Use the following steps to troubleshoot a USB keyboard/mouse. For other USB devices, go to step 7.

1. Disconnect the keyboard and mouse cables from the system briefly and reconnect them.
2. Connect the keyboard/mouse to the USB port(s) on the opposite side of the system.
3. If the problem is resolved, restart the system, enter the System Setup, and check if the non-functioning USB ports are enabled.
4. Replace the keyboard/mouse with another working keyboard/mouse.
5. If the problem is resolved, replace the faulty keyboard/mouse.
6. If the problem is not resolved, proceed to the next step to begin troubleshooting the other USB devices attached to the system.
7. Power down all attached USB devices and disconnect them from the system.
8. Reboot the system and, if your keyboard is functioning, enter the System Setup. Verify that all USB ports are enabled on the **Integrated Devices** screen, in the System Setup options.

If your keyboard is not functioning, you can also use remote access. If the system is not accessible, reset the NVRAM_CLR jumper inside your system and restore the BIOS to the default settings.

9. Reconnect and power on each USB device one at a time.

10. If a device causes the same problem, power down the device, replace the USB cable with a known good cable, and power up the device.

If all troubleshooting fails, see Getting help.

Troubleshooting a serial I/O device

1. Turn off the system and any peripheral devices connected to the serial port.

2. Swap the serial interface cable with a working cable, and turn on the system and the serial device.

   If the problem is resolved, replace the interface cable with a known good cable.

3. Turn off the system and the serial device, and swap the device with a comparable device.

4. Turn on the system and the serial device.

If the problem persists, see Getting help.

Troubleshooting A NIC

1. Run the appropriate diagnostic test. See Using System Diagnostics for available diagnostic tests.

2. Restart the system and check for any system messages pertaining to the NIC controller.

3. Check the appropriate indicator on the NIC connector:
   - If the link indicator does not light, check all cable connections.
   - If the activity indicator does not light, the network driver files might be damaged or missing.
     Remove and reinstall the drivers if applicable. See the NIC documentation.
   - If applicable, change the autonegotiation setting.
   - Use another connector on the switch or hub.

4. Ensure that the appropriate drivers are installed and the protocols are bound. See the NIC documentation.

5. Enter the System Setup and confirm that the NIC ports are enabled on the **Integrated Devices** screen.

6. Ensure that the NICs, hubs, and switches on the network are all set to the same data transmission speed and duplex. See the documentation for each network device.

7. Ensure that all network cables are of the proper type and do not exceed the maximum length.

If all troubleshooting fails, see Getting Help.

Using System Diagnostics

If you experience a problem with your system, run the system diagnostics before contacting Dell for technical assistance. The purpose of running system diagnostics is to test your system hardware without requiring additional equipment or risking data loss. If you are unable to fix the problem yourself, service and support personnel can use the diagnostics results to help you solve the problem.

Enhanced Pre-Boot System Assessment Diagnostics

The Enhanced Pre-Boot System Assessment (ePSA) diagnostics (also known as system diagnostics) performs a complete check of your hardware. The ePSA is embedded with the BIOS and is launched by the BIOS internally. The embedded system diagnostics provides a set of options for particular device groups or devices allowing you to:

- Run tests automatically or in an interactive mode
- Repeat tests
- Display or save test results
- Run thorough tests to introduce additional test options to provide extra information about the failed device(s)
- View status messages that inform you if tests are completed successfully
- View error messages that inform you of problems encountered during testing

⚠ **CAUTION: Use the system diagnostics to test only your system. Using this program with other systems may cause invalid results or error messages.**

📝 **NOTE: Some tests for specific devices require user interaction. Always ensure that you are present at the system terminal when the diagnostic tests are performed.**

1. Power-on the system.
2. As the system boots, press the <F12> key as the Dell logo is displayed.
3. On the boot menu screen, select the **Diagnostics** option.

   The **Enhanced Pre-boot System Assessment** window is displayed, listing all devices detected in the system. The diagnostics starts running the tests on all the detected devices.
4. If you wish to run a diagnostic test on a specific device, press <Esc> and click **Yes** to stop the diagnostic test.
5. Select the device from the left pane and click **Run Tests**.
6. If there are any issues, error codes are displayed.

   Note the error code and contact Dell.

Disabling A Forgotten Password

The system's software security features include a system password and a admin password. The password jumper disables any password(s) currently in use.

1. Open the system.
2. Identify the PSWD jumper on the system board.
3. Remove the PSWD jumper from the system board.

   NOTE: The existing passwords are not disabled (erased) until the system boots without the jumper.
4. Install the cover.

   NOTE: If you assign a new system and/or admin password with the PSWD jumper installed, the system disables the new password(s) the next time it boots.
5. Connect the system to the electrical outlet and power-on the system.
6. Power off the system and disconnect the power cable from the electrical outlet.
7. Remove the cover.
8. Replace the PSWD jumper on the system board.
9. Close the system.

10. Power on the system.
11. Go to the system setup, and assign a new system or admin password.

    For information on assigning a system or admin password, see Assigning A System And Admin Password.

Warning messages

A warning message alerts you to a possible problem and prompts you to respond before the system continues a task. For example, before you format a hard drive, a message warns you that you may lose all data on the hard drive. Warning messages usually interrupt the task and require you to respond by typing y (yes) or n (no).

NOTE: Warning messages are generated by either the application or the operating system. For more information, see the documentation that accompanied the operating system or application.

Alert messages

Systems management software generates alert messages for your system. Alert messages include information, status, warning, and failure messages for drive, temperature, fan, and power conditions. For more information, see the systems management software documentation.
